

Synthetic study of CPUE across sites

We sampled $n = 42$ stations across the watershed. Mean catch per unit effort was 4.2 ± 0.8 ind./m² at reference sites and differed significantly from impacted sites ($p < 0.01$). Species richness correlated with dissolved oxygen ($r = 0.76$). Recovery reached 63.5 % within the study window (95% CI 51-72). See Figure 1 for the dose-response relationship and Table 1 for site means.

Figure 1. Response versus dose ($y = 2x$).

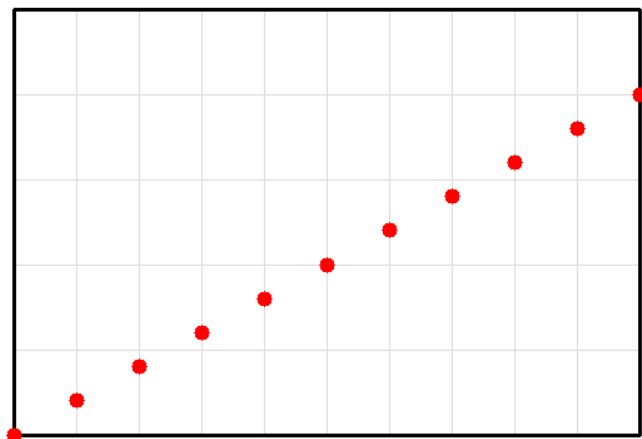

Table 1. Site means.

Site	Mean CPUE	SD	n
Reference	4.2	0.8	14
Impacted	1.9	0.5	14
Recovering	3.1	0.6	14
